Thomy-Walker

Aktive walking and standing system

Give kids the freedom to discover the world all the time.

The Thomy-Walker is much more than just a standing and walking aid for children with movement disorders. Its dynamic support allows children to move their arms and hands freely when standing and walking, experience new adventures and make everyday life more active and integrated. It's incredible to see how the Thomy-Walker helps them discover the world in their own way.

What makes the Thomy-Walker so special?

Its unique design allows children to stand and walk on their own feet – without any saddle-like support. This not only promotes a natural feeling for their own posture, but can also help to prevent possible consequential damage such as contractures or hip misalignments. There are no physical limitations for users, as the Thomy-Walker can be used from a height of 70 cm up to 180 cm and 80 kg.

The best thing?

The easy access from the rear, directly from the wheelchair, makes it so much easier for the child, parents and carers. Because the Thomy-Walker has the spring built into the front of the chassis, the Thomy-Walker can ensure physiological standing and walking, which was previously not possible.

*» He always runs a race with his grandma ...
and of course wins every time, which makes him
incredibly proud and makes him laugh. «*
